fusion protein.
livary gland of the
  causing unstable angina, acute myocardial infarction or stroke. The polymucleotide encoding the polypeptide is useful in gene therapy. The vasodilatory action of the protein allower for the use of lower doses of thrombolytic while maintaining the clot dissolving effectiveness of the thrombolytic, and the use of lower doses of the thrombolytic, and the use of lower sequence is the streptokinase cDNA used in the construction of a Maxadilan-Streptokinase fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GATCTAACATCACGACCTGCTCATGGAGGAAAGACAGAGCAAAGGCTTAAGTCCCAAAATCA

The protein is useful for treating subject suffering from a partially or totally occluded blood vessel,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the

The protein is useful for treating a subject suffering from a partially or totally occluded blood vessel, causing unstable angina, acute myocardial infarction or stroke. The polymucleotide encoding the polypeptide is useful in gene therapy. The vasodilatory action of the protein allows for the use of lower doses of thrombolytic while maintaining the clot dissolving effectiveness of the thrombolytic, and the use of lower doses of the thrombolytic reduces
                                                                                                                                                                                                                                                                                                                                                                                            GATGTCGATACCAACGAATTGCTAAAAGTGAGCAGCTCTTAACAGCTAGCGAACGTAAC

The present sequence encodes native SK. SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPlg) to plasmin (HPlm), which is a serine protease able to catalyse the hydrolysis of fibrin in blood clots. The SK is useful as a thrombolytic agent in the treatment of vascular thrombolytic symptoms such as acute myocardial infarction. Compared with wild-type SK, the K59E mutant

                                                                                                                                                                                                            1172
                                                                                                                                                                                                                             The present invention describes a mutant streptokinase (SK) polypeptide in which at least one of the amino acids in the ProS8-Lys59-Ser60-Lys61 segment of the corresponding native SK is replaced by another amino acid. The present sequence encodes mutant SK K59E. SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPLg) to plasmin (HPLm), which is a serine protease able to catalyse the sydrolysis of fibrin in blood clots. The SK is useful as a thrombolytic agent in the treatment of vascular thrombombolytic symptoms such as acute myocardial infarction. Compared with wild-type SK, the K59E mutant is more resistant to degradation by human plasmin and is more effective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Streptococcus equisimilis H46A, streptokinase; mutant; fibrinolytic; plasma clot; hydrolysis; haemolytic Streptococcus; plasmin, esrine protease; fibrin; blood clot; thrombolytic; vascular thromboembolytic symptom; acute myocardial infarction; fibrinolysis; resistance; ds.

The invention relates to a DNA vector (A) for stable transformation and expression of genes (I) in plastids, where (I) is inserted in an artificial intergene region (ARR) formed by combining two 5-untranslated regions (5-UTRS) of genes that transcribe in different directions and are derived from plants of different divisions or classes. (A) are used to produce transplastomic angiosperms that have improved agronomic properties (e.g. resistance to biotic or abiotic stress) or express a very wide range of agricultural, veterinary, pharmaceutical, nutritional or industrial products, e.g. enzymes, vaccinating antigens, cytokines or immunoglobulins. Use of (A) eliminates the need for a transposon for gene insertion; inserted genes do not require promoters and terminators; and the structure of flanking sequences in (A) ensures universal complicability. Also any selection marker in (A) can be eliminated by homologous recombination. (A) provides efficient and stable expression of genes without causing any functional alterations. This sequence

Patent No. 5876999
GENERAL INFORMATION:
APPLICANT: Hua-Lin Wu
APPLICANT: Guey-Yuch Shi
TITLE OF INVENTION: Preparation of novel streptokinase
TITLE OF INVENTION: mutants as improved thrombolytic agents
NUMBER OF SEQUENCES: 2
CORRESPONDENCE ADDRESS:
ADDRESSE: Jeing & Chang
STREET: Two No. 5876999th Second Street, Suite 290
CITY: San Jose

                                                                                                                                                                                                                                                                                            753
```

```
Properties: Streptokinase gene
The gene product binds to human plasminogen
The gene product is an activator of human plasminogen
                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                           120

Sequence 1, Application US/07703778D

Patent No. 5296366

GENERAL INPORMATION:
APPLICANT: Garcia, M.P.E. et al

TITLE OF INVENTION: OF A GENE WHICH CODES FOR STREEFOKINASE, NUCLECTIDE SEQUENCE
TITLE OF INVENTION: OBTAINED, RECOMBINANT DNA AND TRANSFORMED MICROORGANISMS
NUMBER OF SEQUENCES: 14

CORRESPONDENCE ADDRESS:
ADDRESSEE: Stanger, Michaelson, Spivak and Wallace, Esq.
STREET: P. O. Box 8489

CITT: Red Bank

Search completed: February 1, 2006, 12:43:41 Job time : 273.069 secs Pending Nucleic Acid and Pending Amino Acid database searches generate two sets of results each. The Pending databases have been split into two parts to reduce the amount of time required for their daily updates. This results in more machine time being available for processing searches. Searches run against the Nucleic Acid Pending database produce two sets of results, with the extensions .rnpm and .rnpn
Searches run against the Amino Acid Pending database produce two sets of results, with the extensions .rapm and .rapn

Because they contain data that is confidential, the results of Pending database searches should not be left in the case.
